

ACMP Avira – Management Console

Avira Antivirus for Endpoint management solution

Antivirus software helps you keep your IT environment clean.

But you can only truly protect your business if you can be absolutely certain that the solution is installed, up to date, and enabled on all clients.

You also need to be able to view the current status of all company PCs centrally – as well as receive central notification of any malicious software found.

The German software pros in virus protection and client management, Avira and Aagon, have now united protection and knowledge in a strategic partnership against online threats.

The advantages for you:
Double the German-engineered software for comprehensive protection of your corporate IT systems.

Easy management – dependable protection

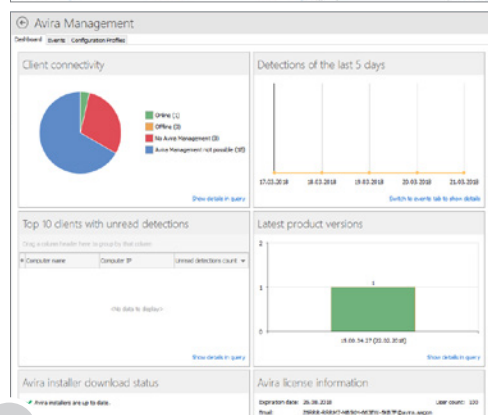

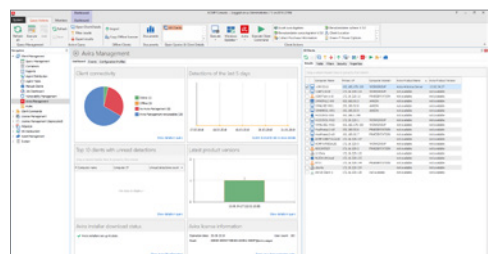

Managing antivirus software should be straightforward. Why pay for expensive additional consultancy services when service should be part of the product in the first place?

ACMP is a breeze to install and really easy to use right from the get-go, offering a fresh view of what effective security management is in an IT environment.

As it can be managed locally, ACMP Avira Management Console provides you with a very high level of data protection and dependable management at all times.

The side benefit is that with the full integration of ACMP, the process of taking a full and comprehensive inventory of your IT environment takes care of itself.

The powerful report engine lets you generate a detailed report on all key information whenever you need it – either fully automatically or on-demand.

Best of all, Avira customers will quickly get to grips with the solution as virtually nothing changes for them – the ACMP interface is only slightly different from the old Avira Management Console.

IT support you
can count on

The dashboard: Security in the spotlight

The new ACMP Avira dashboard provides you with a reliable and accurate picture of the current status of your antivirus environment. You can view all key information at a glance, and even drill down to investigate an individual client machine when in doubt.

This lets you view not only up to four different event types, but also filter them to see only those specific events that truly matter to your work.

The ACMP console lets you assign individual profiles to an overall container or to individual clients, so you can manage Avira expertly in any conceivable IT environment in a company.

To help you do this, you can also choose between English and German language settings.

All available Avira modules can be selected and assigned globally via the ACMP console or managed using the aforementioned profiles.

Contact details:

Aagon GmbH
Lange Wende 33
59494 Soest, Germany
